                                                                                                          An antibody capable of recognising Amyloid A and this peptide but which does not react with other specified peptides (see AAP82046-9) is useful for detection of secondary amyloidosis
                                                                                          Sequence
                                                                                                                                                                                     Anti-amyloid-A protein monoclonal antibody used esp for detection of sec amyloidosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      dehydrogenase (SDH) from Gluconobacter oxydans. The invention includes polynucleotides (AAC83153 - AAC83154) encoding the 3 subunits of SDH (AAB35987 - AAB35989). Also included in the invention are two polynucleotide sequences AAC83156 and AAC83157 which contain the subunit coding regions. The sorbitol dehydrogenase polynucleotide sequences are useful for producing L-sorbose from D-sorbitol and for increasing the production of 2-keto-1-gulonic acid by transforming a host cell, especially Gluconobacter with the DNA and selecting the transformed host cell. The present sequence represents the SDH subunit 2 internal

This antibody is an example of an agonist molecule that specifically binds to or interacts with human granulocyte colony stimulating factor (G-CSF) receptor to stimulate cell proliferation and differentiation, especially by dimerising the receptor or activating phosphorylation of kinases associated with the receptor. Agonist antibodies can be used to stimulate proliferation of G-CSF-dependent cells, e.g. to differentiate leading to a repopulation of neutrophilic granulocyte lineage cells, especially to treat neutropenia (claimed). They can also be used to detect human G-CSF receptor immunologically.
                                                                                                                                           PPPPY motif containing peptide ENaC-beta.
                                                                                                                                                                                                                                                                AAW38119;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptides AAW38115-28 are derived from epithelial sodium channel alpha (ENaC-alpha), beta (ENaC-beta) and gamma (ENaC-gamma) proteins. The peptides contain ppppy-like motifs, which are found in the proline rich regions of WBP-1 and WBP-2 proteins. Peptides containing this residue bind to the YAP WW domain, but not the WW domain from dystrophin or to a panel of SH3 domains. Peptides AW388115-28 were biotinylated and complexed with alkaline streptavidin, and used in a cross affinity mapping experiment. They were tested for their ability to bind to the 3 individual novel WW domains of WWP4 (AAW36797), which were expressed as glutathione-S-transferase expression proteins. The present peptide binds to some of the WW domains of the WW4 protein. The WW domain is a small functional domain. Its name is derived from the observation that two tryptophan residues, one in the amino terminal portion of the WW
                                                                                                                                                                                                                                                                                                                                                                    and growth regulation or the organisation of the cytoskeleton.

Polypeptides containing a WW domain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WW domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WW domains are used for targeted drug screening, i.e. to identify potential modulators of specific WW domain interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Key

                                                                                                                                                                                                                                                              The patent discloses novel colostrum-associated Serum Amyloid A (SAA) from mammals. SAAs are small apolipoproteins that accumulate and associate rapidly with high-density lipoprotein 3 (HDL3) during the acute phase of inflammatory response. They are characterised by the TFLK motif in the N-terminal region which has the ability to stimulate mucin 3 (MUC3) production. Colostrum associated SAAs are used to prevent or treat infectious diseases associated with enteric pathogens (particularly Escherichia coli) such as traveller's diarrhoea, infant diarrhoea, necrotising enterocolitis (NEC), urinary tract infections, and infectious diarrhoea in herd animals. They are used to prevent dysentery and other infectious diseases particularly for the military.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    apolipoprotein; inflammatory response; mucin 3; MUC3; therapy; Escherichia coli infection; traveller's diarrhoea; infant diarrhoea; necrotising enterocolitis; NEC; urinary tract infection; dysentery; infectious diarrhoea.

MAb 1A7 has defined light and heavy chain variable region sequences. The MAb 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 -associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. Sequences MAX49212-216 represent fragments used for comparison with the light chain variable region of MAb 1A7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exo nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

CC probes: Also included are a microarray comprising the novel set of converse the novel set of probes which hybridise at high stringency to a concleic acid expressed in the human lung; measuring gene expression in a cC sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung (mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the exons from genomic sequence by the method constraints and the exons in the exons in several ctissues and/or cell types using hybridisation to a single exon for expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the method are probes/open reading frames (ORF). The probes are used for gene

for

particularly

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614

of.

Claim 27;

SEQ ID No 32115; 634pp; English.

Spatially-addressable set of single exon nucleic acid probes, used

ç

expression

in

human

lung samples

The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part
                     The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label
                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     04-FEB-2000; 2000US-0180312.

                             measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in sample derived from human fetal liver. The present sequence is a peptide encoded by a single exonucleic acid probe of the invention.
Note: The sequence data for this patent did not form part of printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical

                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire value in the proposition of the printed specification, but was obtained in electronic format directly from WIPO at fire value in the proposition of the printed specification.

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, enilensy and cancers. The present sequence is a protein encoded by one of

                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe; microarray; human; placenta; lantenatal diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microraarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                        (MOLE-)
                                                                                                                                                                                                                                                                                                                                30-JAN-2001;

The present invention relates to novel single exon nucleic acid probes (see Aa10010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim
                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                    Novel

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC mRNA, and (b) measuring the label detectably bound to each probe of CC the array; identifying exons in a eukaryotic genome, comprising CC (a) algorithmically predicting at least one exon from genomic sequences CC of the eukaryote; and (b) detecting specific hybridisation of detectably CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, CC having a fragment identical to the predicted exon, the probe is included CC in the above mentioned microarray; assigning exons to a single exon cC comprising (a) identifying exons from genomic sequence by the method CC above and (b) measuring the expression of each of the exons in several ctissues and/or cell types using hybridisation to a single exon cC microarrays having a probe with the exon, where a common pattern of CC expression of the exons in the tissues and/or cell types indicates that CC the exons should be assigned to a single gene; a peptide comprising one CC probes/open reading frames (ORF). The probes are used for gene cexon shall sequences, mentioned in the specification, or encoded by the CC probes/open reading frames (ORF). The probes are used for gene cexon analysis, and for identifying exons in a gene, particularly cusing human lung derived mRNA and for the study of lung diseases CC copp), interstitial lung disease (ILD), familial idiopathic pulmonary disease (CC Niemann-Pick disease. Hermansky-Pudlak syndrome carroidosis culmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into
New serum amyloid A and formyl peptide receptor variant complex and its

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises a peptide agent with a sequence corresponding to SAA, or its conservative variant or functional fragment, bound to FPRL1. Modulators of the SAA/FPRL1 complex are useful for treating immune system
            The present sequence is a fragment of human serum amyloid A (SAA). Invention relates to the discovery that SAA is a ligand for FPRL1 (formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or conservative variant or functional fragment, bound to FPRL1. Modula of the SAA/FPRL1 complex are useful for treating immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and
                                                                                                                                                        New serum amyloid A and formyl peptide receptor variant complex and its modulators, useful for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FPRL1; immunomodulatory; antiinflammatory; antimicrobial; antiarthritic;

                                                                     The present sequence is a fragment of human serum amyloid A (SAA). The invention relates to the discovery that SAA is a ligand for FPRLI (human formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or its conservative variant or functional fragment, bound to FPRLI. Modulators of the SAA/FPRLI complex are useful for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRLI complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FPRL1; immunomodulatory; antiinflammatory; antimicrobial; antiarthritic; antiatherosclerotic; immunosuppressive; SAA/FPRL1 complex; cancer; immune system disorder; amyloidosis; inflammation; infection;

The invention relates to the discovery that SAA is a ligand for FPRL1 (human comprises a peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or its conservative variant or functional fragment, bound to FPRL1. Modulators of the SAA/FPRL1 complex are useful for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRL1 complex.
                                                                                        Human SAA carboxy truncation, SEQ ID NO: 47.

The invention relates to the discovery that SAA is a ligand for FPRL1 (huma formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or its conservative variant or functional fragment, bound to FPRL1. Modulators of the SAA/FPRL1 complex are useful, for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRL1 complex.

The invention relates to the discovery that SAA is a ligand for FPRLI (huma formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or its conservative variant or functional fragment, bound to FPRLI. Modulators of the SAA/FPRLI complex are useful for treating immune system
                                                                                                                                                                                                                                                                                                  Human; serum amyloid A; SAA; human formyl peptide receptor variant; FPRLI; immunomodulatory; anttinflammatory; antimicrobial; antiarthritic; antiatherosclerotic; immunosuppressive; SAA/FPRLI complex; cancer; immune system disorder; amyloidosis; inflammation; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRL1 complex.

The invention relates to the discovery that SAA is a ligand for FPRLI (human formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or its conservative variant or functional fragment, bound to FPRLI. Modulators of the SAA/FPRLI complex are useful for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRLI complex.
                                                            The present sequence is a fragment of human serum amyloid A (SAA). The invention relates to the discovery that SAA is a ligand for FPRLI (human formyl peptide receptor variant).                                                                                                                                                                            The present sequence is a fragment of human serum amyloid A (SAA). The invention relates to the discovery that SAA is a ligand for FPRL1 (human formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or is conservative variant or functional fragment, bound to FPRL1. Modulators of the SAA/FPRL1 complex are useful for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRL1 complex.

(Invention relates to the discovery that SAA is a ligand for FPRL1 (formyl peptide receptor variant). A complex has been isolated that comprises a peptide agent with a sequence corresponding to SAA, or conservative variant or functional fragment, bound to FPRL1. Modula

                                                                                                                                                                                                                                         AAB90295 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis and neoplasia. Fragments of SAA were tested for their ability to modulate assembly of the SAA/FPRL1 complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New serum amyloid A and formyl peptide receptor variant complex and its modulators, useful for treating immune system disorders, amyloidosis, inflammation, infection, organ rejection, arthritis, atherosclerosis
